

SPARKSTATION

SUBDOMAIN LANDER STRATEGY & IMPLEMENTATION BLUEPRINT

Target Subdomain: `welcome.sparkstation.link`

Context Purpose: Feed this exact document into your workspace session with **JJ** to immediately build out the dynamic, high-flexibility, single-page landing page. This architecture recycles the existing standalone demo dashboard asset, bypasses Netlify production build limits, and streamlines your path to your first conversion.

1. Strategic Overview & Core Architecture

To eliminate messaging fragmentation highlighted by external feedback, all marketing traffic is funneled to an isolated sandbox on a separate subdomain. This keeps the primary repository pristine while granting absolute flexibility to iterate on hooks on the fly.

The Zero-Bake Pipeline Advantage:

- **Zero Production Builds:** Avoid burning Netlify build minutes for quick copy updates.
- **Standalone Portability:** The single-page HTML layout directly leverages pre-loaded frontend assets.
- **Isolated Back-End Processing:** Ties into the same Supabase instance and Stripe account via an independent, direct payment link checkout schema, utilizing asynchronous webhooks for user account provisioning.

2. The Three Pillars Messaging Strategy

The landing page isolates and emphasizes three strategic vectors, repositioning SparkStation from a hardware product to an all-in-one physical-to-digital marketing infrastructure suite.

Pillar 1: Unified NFC Hardware (Physical Authenticity)

Focus on premium, artisan-crafted, rugged, and completely non-destructive tags and keychains. Position them as durable brand assets rather than disposable tech novelties.

Pillar 2: Link-in-Bio Style Microsites (Built-In Digital Presence)

Frictionless, mobile-optimized landing platforms featuring native lead capture mechanisms and deep SEO indexing right out of the box.

Pillar 3: Live Analytics & Hyperfast Geo-Mapping (The Performance Loop)

Real-time behavioral telemetry data. Provides physical attribution metrics by dropping instant geo-location pins on an analytical live map at lightning-fast redirect speeds ($t < 200 \text{ ms}$).

The "Bring Your Own Link" (BYOL) Core Paradigm:

Crucially, the software architecture *does not restrict* users to the built-in microsites. Users retain the complete freedom to direct the physical assets to any external URL (e.g., Shopify, Amazon, custom domains, or social handles). The core redirect engine and real-time geographical logging function identically across all external destinations.

3. Wireframe & User Flow Architecture

The single-page lander completely strips out standard header/footer layout navigation elements to maximize intent focus. The layout flows strictly in a single downward path:

1. **Hero Section:** Bold, benefit-centric headline on the left, high-fidelity media or hardware renders on the right. Direct CTA smooth-scrolls directly to the Interactive Sandbox.
2. **Interactive Sandbox (The Recycled Dashboard Asset):** Centered mockup device frame containing the pre-loaded standalone demo dashboard.
3. **Value Proposition Feature Grid:** A tight 3-card layout reinforcing the core pillars immediately beneath the interactive demo frame.
4. **Pricing/CTA Threshold:** Single tier offering the hardware starter kit and automated system provisioning, leading to the dedicated Stripe checkout page.

4. Interactive Sandbox State Logic Code Blueprint

Instruct JJ to locate the standalone dashboard layout file and update the UI controls to mirror the following interactive capability logic. This framework swaps your legacy toast alerts for a high-converting lead generation model:

```
<!-- Interactive Dashboard Simulation Container -->
<div class="dashboard-sandbox">
  <!-- Mode Selector Tabs -->
  <div class="tab-controls">
    <button id="btn-use-microsite" class="active" onclick="setDemoMode('microsite')">
      SparkStation Microsite
    </button>
    <button id="btn-use-custom" onclick="setDemoMode('custom')">
      Bring Your Own Link (BYOL)
    </button>
  </div>

  <!-- Dynamic Target Context Input -->
  <div class="input-context-box" id="url-input-container" style="display: none;">
    <input type="url" id="target-custom-url" placeholder="https://yourbrand.com"
class="url-input">
  </div>
```

```

    <!-- Simulation Fire Button -->
    <button id="simulate-tap-trigger" class="cta-pulse"
onclick="executeSimulatedTap()">
        Simulate Physical NFC Tap
    </button>
</div>

<script>
function setDemoMode(mode) {
    const inputContainer = document.getElementById('url-input-container');
    if(mode === 'custom') {
        inputContainer.style.display = 'block';
    } else {
        inputContainer.style.display = 'none';
    }
}

function executeSimulatedTap() {
    // 1. Immediately drop an active animated pin on the Geo-Map component
    triggerMapPinAnimation();

    // 2. Fetch target URL value to personalize the conversion modal
    const customUrl = document.getElementById('target-custom-url').value || 'your
brand asset';

    // 3. Inject hyperfast redirect telemetry metric on the dashboard UI UI
    displayTelemetrySpeed("0.18s");

    // 4. Intercept the legacy toast and launch the ultimate conversion transaction
modal
    openConversionModal(customUrl);
}
</script>

```

5. Conversion Copy Engine (The Hook Variants)

Use these plug-and-play variants within the landing page setup to systematically experiment with messaging structures:

Headline Hook Variant A (Direct ROI Focus)

Headline: The Physical Marketing Toolbox for Modern Brands.

Subheadline: Deploy rugged, artisan-crafted NFC tags that connect customers to high-converting microsites instantly. Track every tap with live geo-analytics and capture leads on the fly.

Headline Hook Variant B (Routing Freedom & Capability)

Headline: Instantly Change Where Your Physical Assets Link.

Subheadline: Combine premium NFC hardware with hyperfast, SEO-optimized microsites. Update your routing paths, grab leads, and map engagement metrics globally in real time—with zero code required.

The Conversion Modal Script (Flipping the Legacy Toast)

⚡ NFC Tap Routed & Tracked Successfully!

That transaction just traversed the SparkStation redirect array in 180ms, logging precise geographical analytics immediately.

Imagine your audience performing this action in the physical environment using one of our handmade, ultra-rugged keychains or surface-safe tags. No matter where you route them, you possess the metrics. Let's deploy your hardware.

6. Directives for JJ Execution

When you provide this file to JJ, use the following execution prompt to trigger immediate development:

"JJ: Open the landing page project folder and analyze the pre-loaded standalone dashboard assets. Follow the attached strategy file to assemble a single-file HTML/Tailwind index.html layout. Swap the legacy toast notification hook on the 'Save/Tap' event to activate the new split-mode simulation modal. Build it lightweight, completely self-contained, and ready for subdomain DNS mapping."
